Go To Download This invention relates generally to systems for the storage and retrieval of digital data, and more particularly to systems which are applicable in digital processing and transmission systems. At this time, demand is increasingly great for devices for storing large amounts of data in a small area, and there is a need for a system which is applicable to such devices. In addition to recording of data as digital data, the data stored can be also read as analog data which may be used

as a source of information for the data stored. In magnetic disk memory devices, the magnetic properties of a thin film of a magnetic material such as Co-Fe, SiO, or the like are used to store data; and playback is effected by a magnetic head which magnetizes the thin film, modulating the magnetization thereof. In the devices of this type, the head carries a single or a small number of small permanent magnet elements, each of which is separated by some interval from the adjacent ones to thereby permit the number of magnetic heads to be relatively large. In such a head, the number of effective recording spots (independently variable recording) must be large, since the head element is small, 1cdb36666d
